

Jev on OEJTS: Response Tendencies and Repeat Stability

September 30, 2026

Abstract

Ten rounds of the 32 English five-position OEJTS 1.2 items yield 320 valid responses. The scale's scoring rule yields ISTJ in all ten rounds. SN lies closest to its classification boundary and falls exactly on it in two rounds. 25 of 32 items retain the same position in every round. Results describe response and scoring stability under fixed wording.

1 Dataset

OEJTS 1.2 is an open alternative scale released by Eric Jorgenson, not the official MBTI. Each item presents two endpoint descriptions and five positions under a fixed model-self-description instruction. Items are requested independently across ten rounds. Model snapshot: typesafe/jev-1.13-20260917.

The scale's scoring and boundaries are used for IE, SN, FT and JP. Because items include human lived-experience descriptions, this is an exploratory adaptation of model response tendencies. Type counts are repeated scoring outcomes, not personality probabilities.

2 Results

2.1 Overall results

The criterion is the scale's numerical scoring rule; there is no correct-answer accuracy. Selecting the middle position on every item gives 24 on each dimension and ISFJ under the original classification rule, providing a boundary reference.

Measure	Result
Distinct items	32
Complete rounds	10
Valid responses	320
Type counts	ISTJ: 10
Items unchanged across ten rounds	25 / 32

2.2 Dimension stability

Dimension	Mean	Minimum	Maximum	Mean distance from 24	Boundary rounds
IE	13.90	13	15	10.10	0
SN	22.40	22	24	1.60	2
FT	29.90	28	31	5.90	0
JP	16.30	16	17	7.70	0

SN has a mean boundary distance of 1.60, smaller than the other dimensions. An identical type across ten rounds does not imply identical item answers or that every dimension is far from its boundary.

2.3 Scores by round

Round	Type	IE	SN	FT	JP	Boundary
1	ISTJ	14	22	28	16	-
2	ISTJ	14	22	30	16	-
3	ISTJ	13	22	30	17	-
4	ISTJ	13	22	30	17	-
5	ISTJ	14	22	30	16	-
6	ISTJ	14	22	30	16	-
7	ISTJ	13	22	31	16	-
8	ISTJ	15	22	30	16	-
9	ISTJ	15	24	30	17	SN
10	ISTJ	14	24	30	16	SN

2.4 Call costs

Input tokens	Output tokens	Reported cost (USD)
156,530	16,640	0.00657426

All 320 requests have valid responses and billing records, with no unknown charges. There are no results from the official MBTI.

3 Conclusion

Jev shows high repeat stability under the fixed instruction, English wording and position order, yielding ISTJ under OEJTS rules in every round. SN lies near the boundary and some item choices vary. This finding concerns questionnaire responses and scoring, not a validated measurement of model personality.
